Software Catalog

This release includes Software Catalog with capability to discover 120+ new software versions including but not limited to the following software manufacturers like Google, JetBrains & OpenAI

The BigFix Inventory offers a server software catalog that grows the minute new software scan data arrives. The software is discovered using the standard catalog, dynamic patterns, and catalog-less methods that add new software definitions to the server catalog. Enable the Continuous Discovery Processing to benefit from Continuous Server Catalog normalization.

New signatures included in this release:
Template signature is a method of discovery where the version of a component is detected automatically, and a specific version is dynamically added to the catalog. Such template signatures include all component versions. They are used when the software is frequently updated, and the deployment method has not changed. One template covers 10+ software versions.

Publisher Name	Component Name	Platform
Atalasoft	Activate DotImage	WINDOWS
ByteDance	Trae	WINDOWS
Denver Technologies	Warp	WINDOWS & LINUX
Fathom	Fathom	WINDOWS
Fireflies.ai	Fireflies	WINDOWS
JetBrains	Junie	WINDOWS
Paul Giralt	TranslatorX	WINDOWS
The PHP Group	PHP	WINDOWS & LINUX

Changes made to the software component definition in catalog (e.g., modification of component name, version, or publisher) may cause creation of new definition of the component and removal of previous one. This leads to loss of Tagging, Classification and custom EOS information.

Additionally, when discovery is based on a signature evaluated on an endpoint, previous discovery results temporarily disappear until the next software scan and related data import. The new catalog must be propagated to the endpoints before the scan execution.

Updated discovery mechanism for specific software with this behavior includes specific notes (for details and impacted software title refer to the list of enhancements, ideas implemented and list of defects).
